

The 1-channel temperature measuring amplifier IM34-11EX-CI is designed to evaluate the temperature-dependent variations of resistance thermo detectors (RTD) Ni100/ Pt100, thermoelement types B, E, J, K, L, N, R, S and T or low voltages in a range of -160...+160 mV and to output them as linear temperature current signals.

The input circuit of the measuring amplifier is also suited for connection of 2, 3 or 4-wire Ni100/Pt100 resistors. The Ni100/ Pt100 input may be used for external cold junction compensation for the thermoelements or as an independent measuring input.

Parameterization and configuration are implemented with the software tool „Device Type Manager“ (DTM). For this purpose the temperature measuring amplifier is connected to the PC with a 3.5-mm front panel jack. The premoulded transmission cable can be ordered with TURCK under the type name IM-PROG (ident no. 6890422).

The following settings can be made via DTM:

- Connection mode (2, 3, or 4-wire technology)
- Lower measuring range
- Upper measuring range
- Input circuit monitoring for wire-break
- Current output performance in case of errors in the input circuit: 0 or > 22 mA
- Internal or external cold junction compensation
- Output current (0/4...20 mA)
- Temperature unit (°C or °K)
- Mode (resistance thermo detectors (RTD), thermoelement, low voltage, line compensation)

The signals are transformed according to ITS90 IEC 584 for thermoelements and IEC 751 for PT100 and provided as temperature-linear signals at the current output.
